

Salesforce Knowledge Base Test Document

Category: **Salesforce**

Purpose: Controlled document for RAG retrieval and answer-quality testing.

Salesforce Integration

The Salesforce integration uses OAuth 2.0 for authentication. The access token is used to authorize API requests.

When an access token expires, the integration must obtain a refreshed token before making protected API calls.

SMS History records are associated with Salesforce records using the configured phone number and CRM record mapping.

Message Logging

Messages can be logged into SMS History. If the integration configuration is changed to use Notes, new messages may appear under Notes instead of SMS History.

For troubleshooting, verify the integration settings, authentication status, target Salesforce object, and the phone number mapping.

Troubleshooting

If a user cannot access the Conversation View, first verify the configured Salesforce integration and the user's permissions.

A token refresh problem can occur when the integration flow and the native Salesforce flow are configured differently.

Testing note: Questions should be answered only from information contained in this document.
