

Telecom Knowledge Base Test Document

Category: **Telecom**

Purpose: Controlled document for RAG retrieval and answer-quality testing.

SMS Delivery

An SMS request normally contains a destination number, message content, sender information, and authentication details.

A queued response means the request was accepted for processing but does not necessarily mean that the final delivery or downstream record creation has completed.

Opt-In and Opt-Out

OPTIN and OPTOUT requests can be queued for processing.

A successful queue response should be distinguished from confirmation that the customer record has been updated at the portal or downstream system.

Troubleshooting

When a request is queued successfully but the expected portal record is missing, check the request identifier, processing status, downstream logs, and portal-side record creation.

Compare a successful request with a failing request to identify differences in payload fields and processing state.

Testing note: Questions should be answered only from information contained in this document.
